

IUE spectra for longitude region 45-75, where the spectra are denoted by a thick line with symbols and the measurement errors are thin lines symmetric about the spectrum. The 1984-86 data are shown with diamonds and the 1996 data are shown with circles. The spike at 3025 angstroms in the 1984-86 spectra is due to a discontinuity in the solar spectrum used in the albedo calculations.
